AQUAEL

LEDDY TUBE RETROFIT

The LEDDY TUBE lighting modules: energy-saving and versatile

AQUAEL is proud to present yet another novelty product: the replacement LEDDY TUBE RETRO FIT lighting modules.

The LEDDY TUBE modules employ advanced **LED** technology. As a result, they emit the same amount of light as regular fluorescent lamps while **consuming half the energy**, which is important for environmentally conscious consumers and translates into considerable savings on electricity bills. An additional advantage of LED modules is their **durability**. Unlike the regular fluorescent lamps, whose light output drops by half after one year of use, LEDs can be used for many years without replacement, thereby saving even more money.

The LEDDY TUBE modules are **very easy to install**. Each model is supplied with **special adapters** so that they can be assembled into any luminaire. The modules draw power from an independent supply source. Four versions of the product are available: two for freshwater aquariums (LEDDY **SUNNY**, which emits light with a colour temperature of 6500 K similar to natural sunlight, and LEDDY **PLANT** with a colour temperature of 8000 K, designed to enhance the growth of aquatic plants) and two for marine aquariums (LEDDY **MARINE**, which emits light with a colour temperature of 10000 K, designed to improve corals growth and LEDDY **ACTINIC** – 20000 K - for better colours of corals).

Sales arguments:

- consume half as much energy as the regular fluorescent lamps
- long-lasting, do not require frequent replacement
- easy to install
- universal application (supplied with adapters for T8 and T5 sockets)
- a wide range of models is available to replace fluorescent lamps with the power rating of 15 to 54 W
